## Basic java programs for beginners pdf download

Java programs: Basic Java programs with examples & outputs. Here we covered over the list of 500+ Java simple programs for beginners to advance, practice & understood how java programming works. You can take a pdf of each program along with source codes & outputs. In case if you are looking out for C Programs, you can check out that link. We covered major Simple to basic Java Programs along with sample solutions for each method. If you need any custom program you can contact us. All of our Sample Java programs with outputs in pdf format are written by expert authors who had high command on Java programming. Even our Java Tutorials are with rich in-depth content so that newcomers can easily understand. 1. EXECUTION OF A JAVA PROGRAM Static loading: A block of code would be loaded into the RAM before it executed ( i.e after being loaded into the RAM it may or may not get executed ) Dynamic loading: A block of code would be loaded into the RAM only when it is required to be executed. Note: Static loading took place in the execution of structured programming languages. EX: c- language Java follows the Dynamic loading - JVM would not convert all the statements of the class file into its executable code at a time. - Once the control comes out from the method, then it is deleted from the RAM and another method of exe type will be loaded as required. - Once the control comes out from the main ( ), the main ( ) method would also be deleted from the RAM. This is why we are not able to view the exe contents of a class file. Simple Hello Word Program Out of 500+ Simple & Basic Java Programs: Hello world is a first-ever program which we published on our site. Of course, Every Java programmer or C programmer will start with a “Hello World Program”. Followed by the rest of the programs in different Categories. Java Programs Hello World class HelloWorld{ public static void main(String args[]) { System.out.println(“Hello World”); }} Basic Java Programs – Complete List Here 1. Area Of Circle Java Program 3. Area Of Rectangle Program 4. Area Of Isosceles Triangle 7. Area Of Equilateral Triangle 9. Perimeter Of Equilateral Triangle 10. Perimeter Of Parallelogram 11. Perimeter Of Rectangle 14. Volume Of Cone Java Program 19. Curved Surface Area Of Cube 20. Total Surface Area Of Cylinder 21. Fibonacci Series In Java Programs Advanced Simple Programming Examples With Sample Outputs 1. Factorial Program In Java 2. Calculate Electricity Bill 3. Calculate Average Of N Numbers 4. Calculate Discount Of Product 5. Calculate Distance Between Two Points 6. Calculate Commission Percentage 9. Calculate Batting Average 10. Calculate CGPA Java Program 11. Compound Interest Java Program 12. Calculate Average Marks 13. Addition Of Two Numbers 15. Armstrong Number In Java 17. Reverse A String In Java 18. Matrix Multiplication In Java 19. Future Investment Value 20. HCF Of Two Numbers Program 22. Java Program Vowel Or Consonant 23. Perfect Number In Java 25. Matrix Multiplication In Java 25. Addition Of Two Matrices 26. Subtract Two Matrices 28. Check Leap Year Or Not 30. Prime Number Java Program 31. Sum Of A Digits Of Number String, Array Programs 1. Reverse A String In Java 2. Count Vowels In A String Program 3. Reverse A Number In Java Program 4. Reverse An Array Program 5. Insert An Element In Array 6. Linear Search In Java some text some text Sort Programs Conversion Programs: 1. Convert Octal To Hexadecimal 2. Convert Decimal To Hexadecimal 3. Convert Decimal To Octal 4. Convert Decimal To Binary 5. Convert Fahrenheit To Celsius 4. 8 Star Pattern In Java 5. Invert Pyramid Star Pattern 6. Hollow Right Triangle Star Pattern 7. Hollow Rhombus Star Pattern 10. Right Arrow Star Pattern 14. Mirrored Right Triangle 15. Mirrored Half Diamond Star Pattern Program 16. Left Arrow Star Pattern 18. Half Diamond Star Pattern Program 19. Inverted Right Triangle Star 20. Hollow Inverted Pyramid Star Pattern 22. Hollow Inverted Mirrored Right Triangle 23. Inverted Mirrored Right Triangle 24. Hollow Inverted Right Triangle Star Pattern 25. Hollow Mirrored Right Triangle 26. Hollow Rhombus Pattern 27. Inverted Pyramid Star Pattern Functions of JVM: It converts the required part if the bytecode into its equivalent executable code. It loads the executable code into the RAM. Executes this code through the local operating system. Deletes the executable code from the RAM. We know that JVM converts the class file into its equivalent executable code. Now if a JVM is in windows environment executable code that is understood by windows environment only. Similarly, same in the case with UNIX or other or thus JVM ID platform dependent. Java, With the help of this course, students can now get a confidant to write a basic program to in-depth algorithms in C Programming or Java Programming to understand the basics one must visit the list 500 Java programs to get an idea. Users can now download the top 100 Basic Java programming examples in a pdf format to practice. But the platform dependency of the JVM is not considered while saying Java is platform independent because JVM is supplied free of cost through the internet by the sun microsystems. Platform independence : Compiled code of a program should be executed in any operating system, irrespective of the as in OS in which that code had been generated. This concept is known as platform independence. The birth of oops concept took place with encapsulation. Any program contains two parts. Date part and Logic part Out of data and logic the highest priority we have given to data. But in a structured programming language, the data insecurity is high. Thus in a process, if securing data in structured prog. lang, the concept of encapsulation came into existence. Note: In structured programming lang programs, the global variable play a vital role. But because of these global variables, there is data insecurity in the structured programming lang programs. i.e functions that are not related to some variables will have access to those variables and thus data may get corrupted. In this way data is unsecured. “This is what people say in general about data insecurity. But this is not the actual reason. The actual concept is as follows”. Let us assume that, we have a ‘C’ program with a hundred functions. Assume that it is a project. Now if any upgradation is required, then the client i.e the user of this program (s/w) comes to its company and asks the programmers to update it according to his requirement. Now we should note that it is not guaranteed that the programmers who developed this program will still be working with that company. Hence this project falls into the hands of new programmers. Automatically it takes a lot of time to study. The project itself before upgrading it. It may not be surprising that the time required for writing the code to upgrade the project may be very less when compared to the time required for studying the project. Thus maintenance becomes a problem. If the new programmer adds a new function to the existing code in the way of upgrading it, there is no guarantee that it will not affect the existing functions in the code. This is because of global variables. In this way, data insecurity is created. To overcome this problem, programmers developed the concept of encapsulation. For example, let us have a struc.prog.lang. program with ten global variables and twenty functions. It is sure that all the twenty functions will not use all the global variables. Three of the global variables may be used only by two functions. But in a structured prog. Lang like ‘C’ it is not possible to restrict the access of global variables by some limited no of functions. Every function will have access to all the global variables. To avoid this problem, programmers have designed a way such that the variables and the functions which are associated with or operate on those variables are enclosed in a block and that block is called a class and that class and that class is given a name. Just as a function is given a name. Now the variables inside the block cannot be called as the local variable because they cannot be called as global variables because they are confined to a block and not global. Hence these variables are known as instance variables Ex : Example: 12345678910111213141516171819202122232425262728293031323334353637 struct. Prog. Lang. program# include < stdio.h>int i,j,k,l,m,n;fun 1 ( ) {-----}Fun 2 {-----}Fun 10 ( ) {-----}Main ( ) {-----} Example 2 : Example : 2 1234567891011121314151617181920212223242526272829303132333435 Oop. Lang programClass AbcInt i,j,kFun 1 ( ) {-----}Class Xyz{Int l,m,n;Fun 3 ( ) {-----}Fun 4 ( ) {-----} Therefore a class is nothing but grouping data along with its functionalities. Note 1: Encapsulation it’s the concept of binding data along with its corresponding functionalities. Encapsulations came into existence in order to provide security for the data present inside the program. Note 2: Any object oriental programming language file looks like a group of classes. Everything is encapsulated. Nothing is outside the class. Encapsulation is the backbone of oop languages. JAVA supports all the oop concepts ( i.e. encapsulation, polymorphism, inheritance) and hence it is known as an object-oriented programming language. C++ breaks the concept of encapsulation because the main ( ) method in a C++ program is declared outside a class. Hence it is not a pure oop language, in fact, it is a poor oop language.
